## 1. Features

The difference between 200CR and 240CR is as follows:

Function	200CR/PCR-360/PCR-365	240CR/PCR-460
POP display	Nil	Available
Stamp function	Nil	Available
Customer display	Available	Available
Power protection function	Nil	Nil
LED transaction	Nil	Available
EEPROM	Nil	Available (except PCR-460)
Calculator function	Available	Available

### 3. Mac (Memory All Clear) operation

#### Procedure A

- (1) Plug the power cord into an outlet.
- (2) Pressing the FEED button and turn the mode switch to PRG position.
- (3) Release the FEED button. After few seconds, MAC operation will be executed.
- (4) The following receipt will be issued, if completed.

#### Procedure B

- (1) Remove the power cord from AC outlet.
- (2) Remove the memory protection battery.
- (3) Leave the machine for few minutes.
- (4) Plug the power cord to AC outlet and then MAC operation is executed.
- (5) Set the memory protection battery.

## 4. Diagnostic operation

### 4-1. How to start

- (1) Plug the power cord into an outlet.
- (2) Execute the MAC operation.
- (3) Turn the mode switch to "PRG" position.
- (4) Input 99990000 and press the sub total button.
- (5) Start the diagnostic program and issues the following receipt.

**Note :** If you have done the registration after MAC operation, the Diagnostic program can not start.

026, 020 are effected for ST.

### 4-4. Hard check function

Enter 1 digit from numeral key and press the sub total (ST), the following Hard check function will be executed.

- (1) 1 + ST : Display, RAM, Drawer, Printer test
- (2) 2 + ST : Print test
- (3) 3 + ST : Read/Write test for EEPROM
- (4) 4 + ST : Read test for EEPROM
- (5) 5 + ST : RAM read test
- (6) 7 + ST : Voltage check for memory protection battery
- (7) 8 + ST : Print all characters
- (8) 9 + ST : Display the time
- (9) 6 + ST : Country code write to EEPROM

#### 4-4-1. Display, RAM, drawer and printer check

Operation : 1 + ST

- 1) All segments turn on.

----	----	----	----	----	----	----	----

- 2) Date and time set.

Date : 31st December 1995

Time : 23 : 59 : 00 P.M.

Above conditions are automatically set on the machine.

3) RAM write and read check

The machine writes data into RAM and read out the data to compare with written data. When this check is finished correctly, the machine goes to check No. 4).

However, if an error is occurred, the machine sounds an error tone, prints the error receipt, and stops Hard check program.

Error receipt sample " — — — — — — — 2"

4) Drawer open check

5) Receipt issue

6) Test character print

7) Test display

1 2 3 4 5 6. 7 8

**Note :** Decimal point on the display depends on the PAD condition.

**4-4-2. Print test**

Operation :  +

Prints the following character continuously.

To stop this test, press any key or turn the mode switch to "OFF" position.

Print character

Printing speed

45 times / Min.

**Note:** In case press "   +  ", the following test is executed.

Printing speed: 25 times / Min.

Drawer open : 5 times / Min.

Stamp print: 5 times / Min.

#### 4-4-3. Read/write test for EEPROM

Operation : 3 + ST

Execute the Read/write test in test area (1word) of EEPROM.

**Note:** This test is effected on 240CR only.

If an error is occurred, the machine sounds an error tone, prints " — — — — — — — 8" on receipt, and stops this test.

#### 4-4-4. Read test for EEPROM

Operation : 4 + ST

The machine reads out the data to compare with written data until an error is occurred and brinks "—" on the display during this test.

**Notes:** This test is effected on 240CR only.

If an error is occurred, the machine sounds an error tone, prints " — — — — — — — 8" on receipt, and stops this test.

To stop this test, turn the Mode Switch to "OFF" position.

Be sure to execute the Read/write test for EEPROM (3+ST) before this test.

#### 4-4-5. RAM read only check

Operation : 5 + ST

**Note:** Be sure to execute the RAM write and read check (1 + ST) before this check.

The machine reads out the data to compare with written data until an error is occurred and brinks " — " on the display during this check.

To stop this check, turn the mode switch to OFF position.

If an error is occurred, the machine sounds an error tone, prints " — — — — — — — 2" on the receipt, and stops this check.

#### 4-4-6. Voltage check of memory back-up battery

Operation : 7 + ST

Display the voltage of back-up battery in real time. (Measurement is Volt (V) level.)

To stop this check, press any key or turn the mode switch to OFF position.

	X	X	X				L

**Note:** In case press "   +  ", prints all characters continuously.

To stop this test, turn the mode switch to "OFF" position.

#### 4-4-8. Display the time

Operation :  +

The machine display the time.

To stop this check, press any key.

23 — 59 01      The time counts up.

#### 4-4-9. Country code write

Operation : X 6 + ST

X : Country code

Erase the EEPROM and write the country code into EEPROM.

**Note:** This test is effected on 240CR only.

#### 4-4-10. How to release the diagnostic mode

Make MAC operation.

### [PWD signal]

After plug the AC cord into outlet, VP voltage appears on the base terminal of transistor Q3. When the VP exceeds 13 volts, Q3 is turned on by the differential voltage between base and emitter of Q3.

Then the PWD signal goes to GND level and informs "power on" to the CPU.

When the VP drops less than 13 volts, Q10 is turned off.

Then the PWD goes high level since the PWD is pulled up to VDD and makes the CPU go "Power failure process".

**Note :** During plug the AC cord into outlet, all voltages are supplied to the PCB.  
If you open the machine for repair, make sure plug off.

**Note :** The "PW-on level" was measured under the following conditions.

Mode switch is REG position.

### 5-3. Mode key switch status read

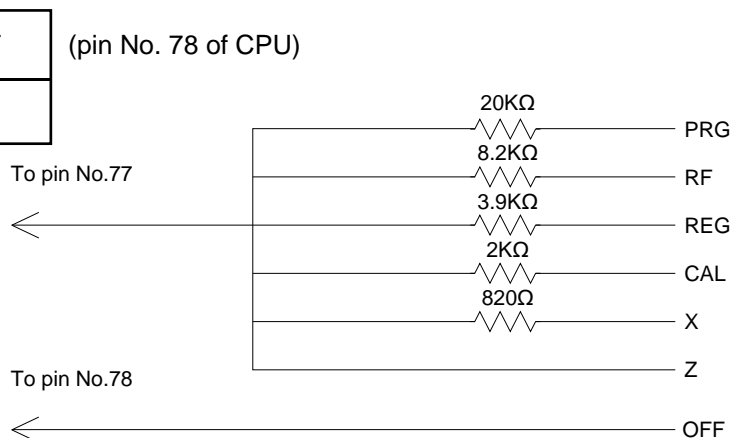

The CPU knows the mode swithc status by voltage level of 1 pin No. 77.

The voltage level is down by resistor. Each voltage is as shown bleow.

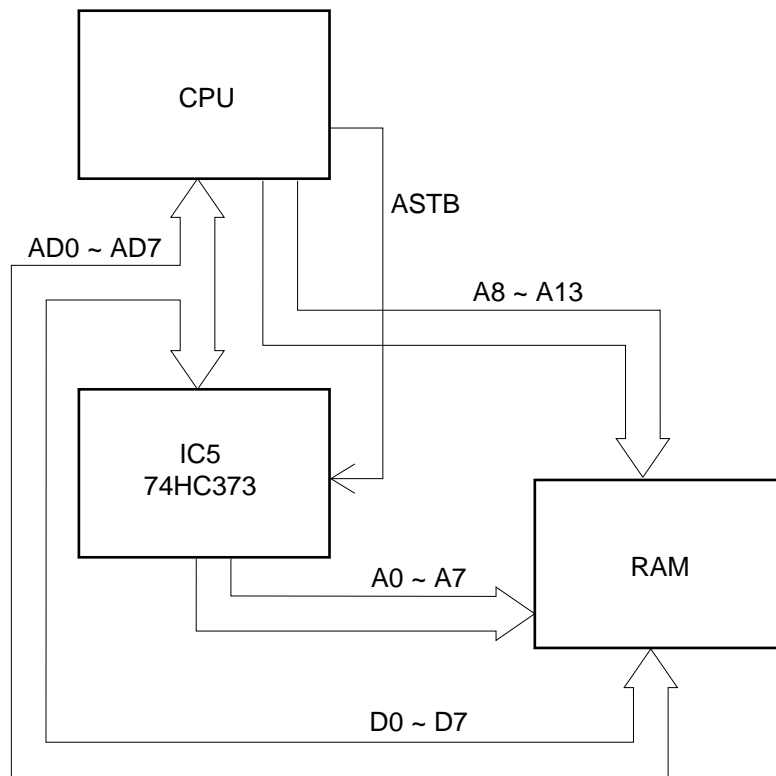

Voltage level (pin No. 77 of CPU)

Mode	PRG	RF	REG	CAL	X	Z
Voltage (V)	4.0	3.3	2.4	1.7	0.9	0.1

Mode	OFF →	except OFF
Voltage	0	5

#### 5-4. RAM address

CPU is used port 40 ~ 47 (pin No. 19 ~ 26) for address/data bus.  
CPU sends the address A0 ~ A13 to RAM through the IC5. To select the address A0 ~ A7, CPU send the address AD0 ~ AD7 to IC5. Then CPU sends ASTB (Latch enable) signal to IC5.  
IC5 outputs the address A0 ~ A7 after receipt of ASTB signal.

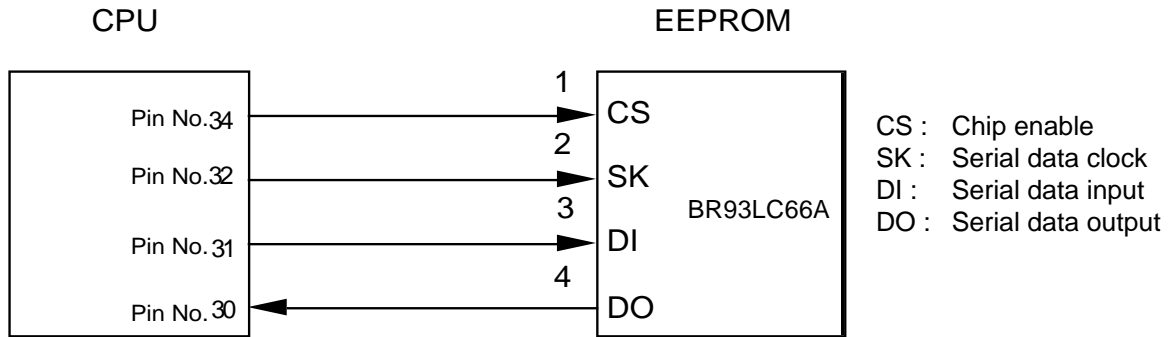

#### 5-5. Initialize IC (Reset IC)

When the voltage level on 60 pin of CPU is not stabilized, CPU doesn't work properly in rare case. Therefore, this machine uses the initialize IC for stabilizing the voltage.  
Even the voltage level of VDD (2 pin) is changed, 1 pin of initialize IC outputs stabilized 5 volts.

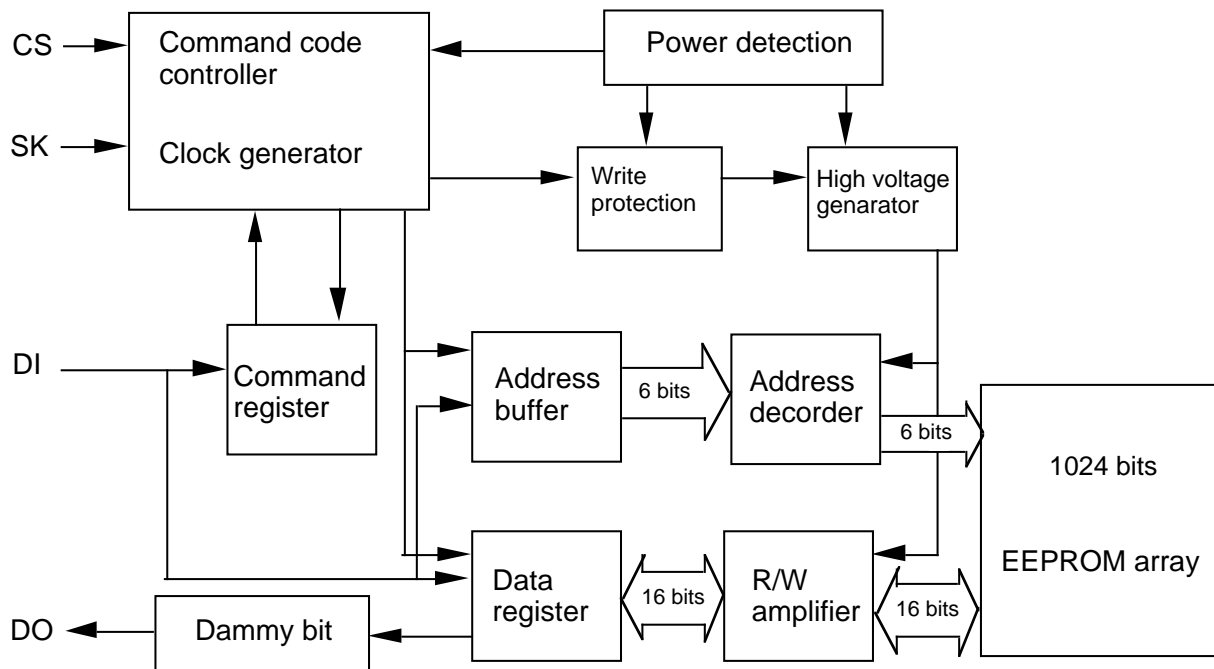

## 5-6. Data communication between CPU and EEPROM

EEPROM is a memory to possible write/erase by electricity .

The BR93LC66A provides efficient nonvolatile read/write memory arranged as 64 registers of 16 bits each.

### [Block diagram]

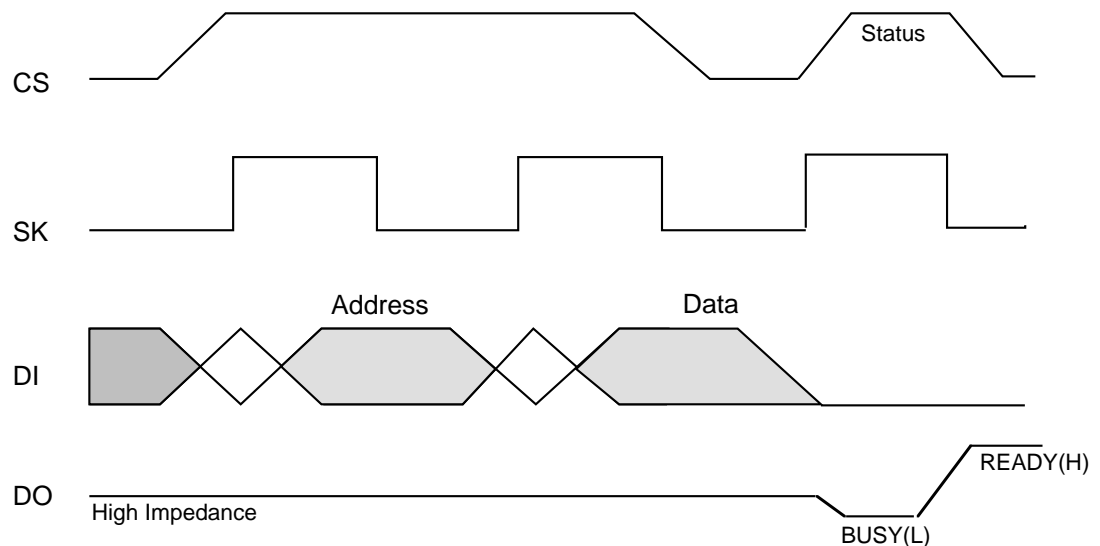

### [Data reading procedure]

When the CPU read the data of EEPROM, CPU send the CS signal and SK signal to EEPROM. Then, CPU send the address to EEPROM, and then EEPROM send the data to CPU.

### [Data writing procedure]

When the CPU save the data to EEPROM, CPU sends the CS and SK signal to EEPROM. And CPU send the address and data to EEPROM from pin No.31. When the EEPROM writes the data, EEPROM outputs the busy signal from DO terminal to CPU. After finish writing, EEPROM outputs the ready signal from DO terminal to CPU.

## 5-7. Notice of display LEDs

This machine is using display LED.

Specification of original LED is HDSP-5621#S02.

The following LEDs are interchangeable parts. However, its brightness is different.

If you replace it for repair, use the same specification.

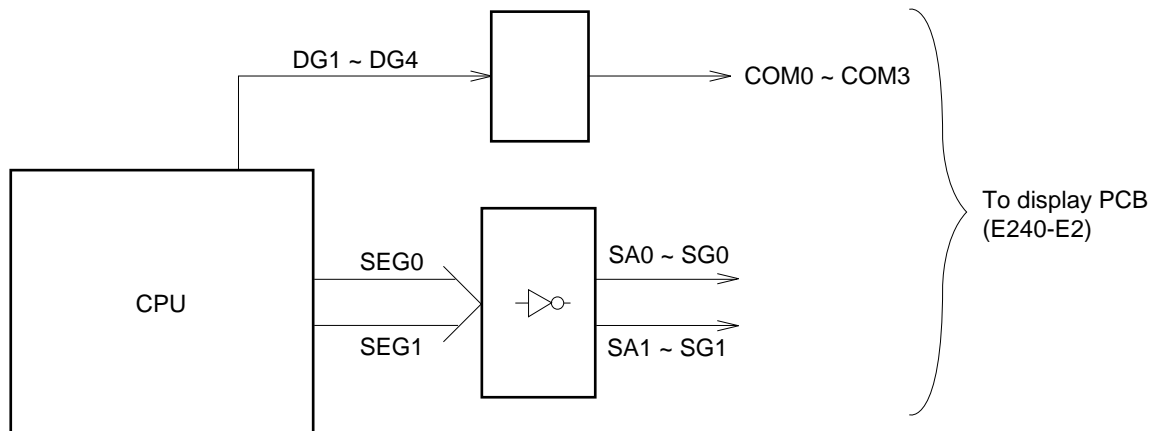

Specification	Parts Code
HDSP-5621#S02	2320 1365
HDSP-5621 hp029 H4	2320 1368
HDSP-5621 hp029 G4	2320 1367

H type LED is a little bit brighter than G type.

Specification is written on the top of parts.

## 5-8. Display control circuit

## 5-9. Printer drive circuit

When CPU wants to rotate the motor, CPU outputs "Motor" signal (L → H), and Motor signal goes through the motor drive circuit and then it become "L". Then Motor rotates because of difference voltage between Motor and Motor COM TERMINAL.

Head drive signal is same as Motor drive.

## 5-10. IC data

### 1. BA12001/BA12004

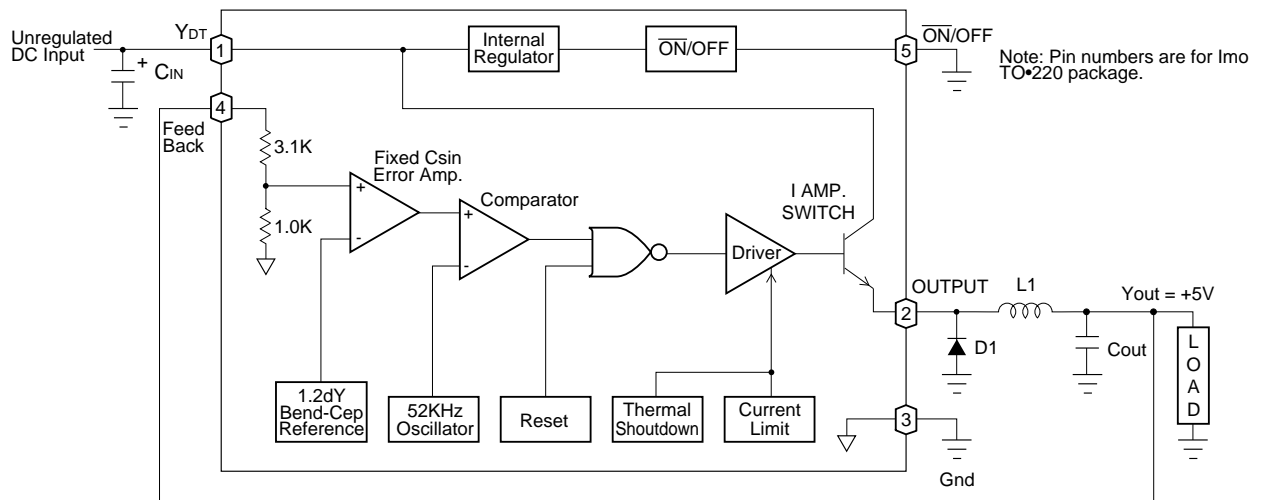

### 2. LC3654

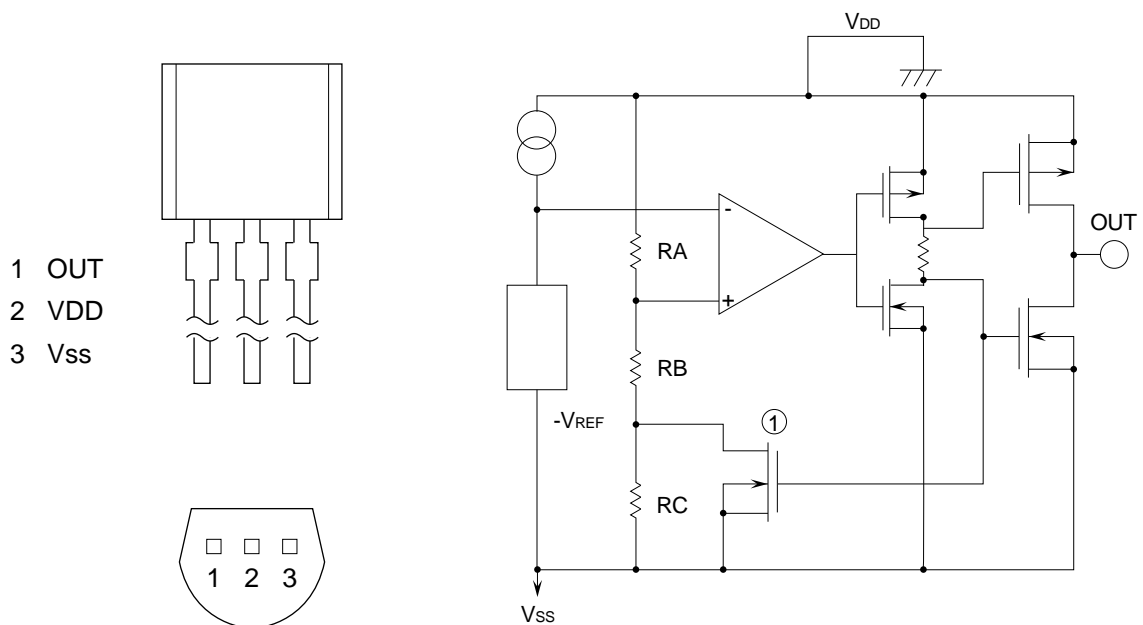

A0 ~ A12 : Address  
 WE : Write enable  
 CE1 : Chip enable 1  
 CE2 : Chip enable 2  
 I/O1 ~ I/O8 : Data  
 Vcc/GND : Power terminal

### 3. LM2575T-5. 0/LB03

### 4. S80730AL

## 5. TC74HC373P

The TC74HC373 is a high speed CMOS OCTAL LATCH with 3-STATE OUTPUT fabricated with silicon gate C<sup>2</sup>MOS technology.

This IC achieves the high speed operation similar to equivalent LSTTL while maintaining the CMOS low power dissipation.

These 8-bit D-type latches are controlled by a latch enable input (LE) and a output enable input ( $\overline{OE}$ ). While the LE input is held in high level, the Q outputs will follow the data input precisely or inversely. When the LE is take low, the Q outputs will be latched precisely or inversely at the logic level of D input data.

While the  $\overline{OE}$  input is at low level, the eight outputs will be in a normal logic state (high or low logic level) and while high level the outputs will be in a high impedance state.

An application designer has a choice of combination of inverting and non-inverting outputs, symmetrical and neighbouring input/output pin layout.

The three-state output configuration and the wide choise of outline will make the busorganized system simple.

All inputs are equipped with protection circuits against static discharge or transient excess voltage.

### 5-11. Error code

Error Code	Meaning	Action
E01	Mode Switch position changed before finalization.	Return the Mode Switch to its original setting and finalize the operation.
E08	Registration without entering a clerk number. This error appears only when the clerk control function is activated.	Enter a clerk number.
E31	Finalization of a transaction attempted without confirming the subtotal.	Press the <b>[ST]</b> key.
E33	Finalize operation attempted without entering amount tendered.	Enter the amount tendered.
E38	READ/RESET operation without declaring cash in drawer. This error appears only when this function is activated.	Perform money declaration.
E94	Printer error.	Turn the power off, and remove jammed paper from the printer.

## 6. How to open upper case

1. Remove the printer cover.
2. Remove the screw ①.
3. Slide the keyboard cover to arrow direction and pull it down to release the hooks 4 and then remove the keyboard cover.
4. Press the hock to display side and pull up the front and remove the upper case.

**Note:** Be sure to stand the customer display before remove the upper case.

## 7. Remove the drawer

1. Remove the drawer connector.
2. Remove the screws ②, ③, ④ and ⑤.
3. Slide the lower case to arrow direction and pull up the lower case.

### Notes:

1. Price and specifications are subject to change without notice.
2. As for order / supply of spare parts, refer to the "GUIDE BOOK for spare parts supply" a separate publication
3. The numbers in the item column correspond to the same numbers in exploded drawing.
4. MARKS:

Q: Quantity used per unit

R: Rank

A: Essential

B: Stock recommended

C: Less recommended

X: No stock recommended

### Notes:

1. Price and specifications are subject to change without notice.
2. As for order / supply of spare parts, refer to the "GUIDE BOOK for spare parts supply" a separate publication
3. The numbers in the item column correspond to the same numbers in exploded drawing.
4. MARKS:

Q: Quantity used per unit

R: Rank

- A: Essential
- B: Stock recommended
- C: Less recommended
- X: No stock recommended
